DEVELOPER HANDOFF DOCUMENT

Website Tracking & Verification Implementation Guide

Target website: readycar.store | Meta Pixel, Meta Domain Verification, Microsoft Clarity and Google Analytics 4

Purpose
Please implement the four provided tracking and verification snippets directly in the website code, publish the changes, and confirm that every integration is live and loading correctly.

Required implementation order

Component	Required placement / action
1. Google Analytics 4	Paste the Google tag immediately after the opening <head> tag on every website page.
2. Meta verification	Place the meta verification tag inside the homepage <head> section. It must be static in the source code and not injected through JavaScript.
3. Microsoft Clarity	Paste the Clarity script inside the <head> element and make it available site-wide.
4. Meta Pixel	Paste the complete Meta Pixel base code inside the <head> element, under other existing head code and before the closing </head> tag.

Global technical rules

- Add each code snippet only once. Do not duplicate tags across templates, plugins, app layouts, or tag managers.
- Keep the supplied IDs and verification value exactly as provided. Do not edit, replace, or regenerate them.
- Apply the tracking code to all public pages, including mobile, desktop, and any localized or dynamic page templates.
- Publish/deploy the changes after implementation, then complete the checks listed on the final page of this document.

Important: If the website already has Google Tag Manager, an existing Meta Pixel, or an existing GA4 tag, please notify the marketing team before adding a second instance.

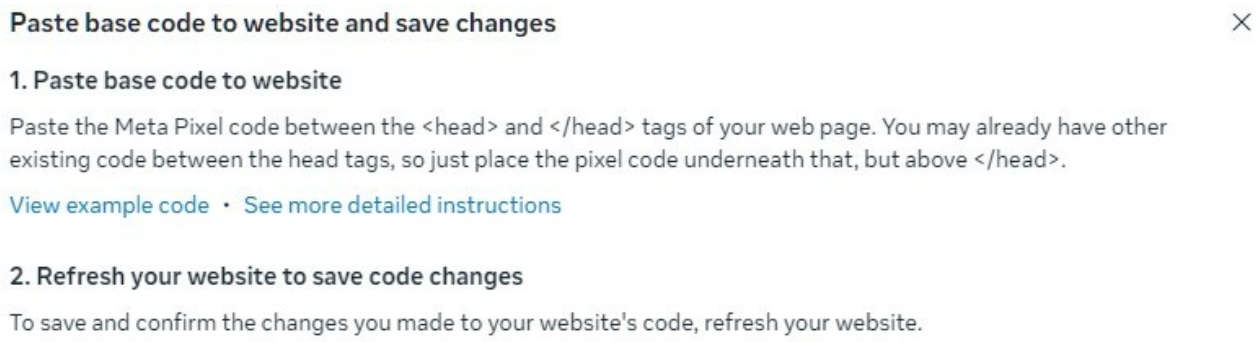

01 / META PIXEL

Meta Pixel Base Code

Install this code site-wide within the <head> section. Place it below any existing head code and above the closing </head> tag.

Implementation note
Use the full snippet below exactly as written, including the <noscript> fallback. The Pixel ID is 1447711580456108.

```
<!-- Meta Pixel Code -->
<script>
!function(f,b,e,v,n,t,s)
{if(f.fbq)return;n=f.fbq=function(){n.callMethod?
n.callMethod.apply(n,arguments):n.queue.push(arguments)};
if(!f._fbq)f._fbq=n;n.push=n;n.loaded=!0;n.version='2.0';
n.queue=[];t=b.createElement(e);t.async=!0;
t.src=v;s=b.getElementsByTagName(e)[0];
s.parentNode.insertBefore(t,s)}(window, document,'script',
'https://connect.facebook.net/en_US/fbevents.js');
fbq('init', '1447711580456108');
fbq('track', 'PageView');
</script>
<noscript><img height="1" width="1" style="display:none"
src="https://www.facebook.com/tr?id=1447711580456108&ev=PageView&noscript=1"
/></noscript>
<!-- End Meta Pixel Code -->
```

Reference: Meta instructs that the base Pixel code should be pasted between the <head> and </head> tags, then the website should be refreshed/published.

Developer confirmation required

- Confirm that the Meta Pixel base code is present on all live public pages and that the PageView event fires once per page load.

02 / META DOMAIN VERIFICATION

Meta Domain Verification Tag

Place this verification tag inside the homepage HTML <head> section, then publish the homepage.

Critical requirement
The tag must appear in the page source within <head>...</head>. Verification can fail if it is outside the head section or added dynamically through JavaScript.

Verification meta tag

```
<meta name="facebook-domain-verification" content="in6pbkimcdss22q2y8nbnqai5xeiuj" />
```

After publishing

- Open the live homepage at https://readycar.store/ (or the final canonical homepage URL).
- View the page source - not only the browser inspector - and search for facebook-domain-verification.
- Confirm that the exact meta tag and its content value are visible in the server-delivered source.
- Notify the marketing team so domain verification can be completed in Meta Business Settings.

> 2. Paste the meta-tag into the **<head>...</head>** section of the website's home page HTML source, and publish the page.
> Note: Verification will fail if the meta-tag code is outside of the <head> section or in a section loaded dynamically by JavaScript.

> 3. After you've published the home page, confirm that the meta-tag is visible by visiting http://readycar.store/ and viewing the HTML source.

Reference: Meta requires the meta-tag in the homepage <head>...</head> section, then asks for confirmation that it is visible in the live HTML source.

03 / MICROSOFT CLARITY

Microsoft Clarity Tracking Code

Paste the following script inside the <head> element of the website or application and load it site-wide.

Implementation note
The Clarity project ID is xf62eh7pq5. Do not place multiple copies of this script on the same page.

```
<script type="text/javascript">
    (function(c,l,a,r,i,t,y){
        c[a]=c[a]||function(){(c[a].q=c[a].q||[]).push(arguments)};
        t=l.createElement(r);t.async=1;t.src="https://www.clarity.ms/tag/"+i;
        y=l.getElementsByTagName(r)[0];y.parentNode.insertBefore(t,y);
    })(window, document, "clarity", "script", "xf62eh7pq5");
</script>
```

Reference: Microsoft Clarity instructs that its code should be copied into the <head> element of the site or app.

Developer confirmation required

- Confirm that the Clarity script loads on the live website without console errors and that the site does not contain a duplicate Clarity project tag.

04 / GOOGLE ANALYTICS 4

Google Analytics 4 - Google Tag

Paste the Google tag immediately after the opening <head> element in the code of every page on the website.

Implementation note
The GA4 Measurement ID is G-253NTEC163. Do not add more than one Google tag to the same page.

```
<!-- Google tag (gtag.js) -->
<script async src="https://www.googletagmanager.com/gtag/js?id=G-253NTEC163"></script>
<script>
  window.dataLayer = window.dataLayer || [];
  function gtag(){dataLayer.push(arguments);}
  gtag('js', new Date());

  gtag('config', 'G-253NTEC163');
</script>
```

Below is the Google tag for this account. Copy and paste it in the code of every page of your website, immediately after the <head> element. Don't add more than one Google tag to each page.

Reference: Google specifies that the tag should be placed immediately after the <head> element and only one Google tag should be added to each page.

Developer confirmation required

- Confirm that the GA4 tag loads on every public page and that a real-time page view is received in the GA4 property for Measurement ID G-253NTEC163.

FINAL QA & DELIVERY

Go-Live Checklist

Please complete the checks below after deployment and return a brief confirmation with screenshots or test URLs where applicable.

1. Code placement & deployment

- Google tag is immediately after <head> on every public page.
- Meta domain verification tag is visible in the static homepage source inside <head>...</head>.
- Microsoft Clarity script is inside <head> and is loaded only once per page.
- Meta Pixel base code is inside <head>, below existing head code and before </head>.
- Website changes have been published/deployed to the live production domain.

2. Tracking validation

- Meta Pixel: Confirm a single PageView event fires for Pixel ID 1447711580456108.
- GA4: Confirm a real-time page_view event is received for Measurement ID G-253NTEC163.
- Microsoft Clarity: Confirm new sessions begin appearing in the Clarity project xf62eh7pq5.
- Meta domain verification: Confirm the verification tag can be seen in the live homepage source and proceed with the verification step in Meta.

Suggested implementation reply

“All four code snippets have been added and deployed to readycar.store. The Meta Pixel, Meta verification tag, Microsoft Clarity and GA4 tag are present in the required head locations. The homepage source shows the verification tag, and the tracking tags are loading once per page.”

Tracking identifiers

Component	Required placement / action
Meta Pixel ID	1447711580456108
Meta verification value	in6pbkimcdss22q2y8nbnqai5xeiuj
Microsoft Clarity project ID	xf62eh7pq5
GA4 Measurement ID	G-253NTEC163

Do not remove, replace or duplicate any of the identifiers above without approval from the marketing team.
